

January 2011 - Trailer at Tealing

A specially modified PDtect@4 Mobile system has gone on site at the SSEPD substation at Tealing as part of field trial to gather weather data and relate to partial discharge activity. This is being funded through IFI and is part of a larger development to enhance the operational use and benefits of the existing trailer.

Martin Queen, SSEPD said "We are always looking to evaluate new concepts and technology that can help improve our Electricity Networks. This project seeks to give us a better understanding of the nature of partial discharge and the ability of this technology to meet operational needs"
